1. Introduction

In December 2007 the Institut für Schweißtechnik und Ingenieurbüro Dr. Möll GmbH received from the IKEA Distribution Services GmbH pieces of uprights of a pallet rack installation in order to conduct compression tests. According to IKEA three pieces have been taken out of undamaged parts of the racks and three others out of parts, that have been damaged before and repaired afterwards. Each one pair of damaged and undamaged upright pieces was taken from one rack upright.

The purpose of the tests is compare the load bearing capacity of the damaged and repaired uprights. Further the test result are compared with the theoretic load bearing capacity.

In order to check the material properties, tensile tests on strips, that have been taken out of the tested uprights, were carried out. The results of these tests are documented in annex A.4.

2. Versuchsaufbau und -durchführung

For the tests cap plates with a thickness of ca. 30 mm were welded to both ends of the upright pieces.

The specimen were loaded axially through ball bearings at their ends. The load is increased slowly until failure.

The length L_t between the ball bearings was in all tests 1232 mm. The Length L_{upr} the upright pieces between the cap plates was in all tests ca. 1150 mm.

The load was applied on the axis of symmetry at a distance of $e = 26,5$ mm from the front of the upright.

The upright type was PLU 15 of the rack manufacturer STOW International NV.

Significant deformations of the repaired uprights could not be observed. According to IKEA these uprights have been repaired for the first time.

3. Test results

In the compression test the following maximum loads F_{\max} could be reached:

Test No	F_{\max} [kN]	Condition
N I	139,20	undamaged
R I	143,20	repaired
N II	147,20	undamaged
R II	142,65	repaired
N III	154,90	undamaged
R III	157,80	repaired

The test pieces with the same roman numerals are from also taken out of the same rack upright and therefore can be compared directly with each other. The comparison shows, that the repaired specimen fail - within the usual tolerances - at the same load as the undamaged upright pieces. That means, that the repair lead here to no measurable reduction of the load bearing capacity.

The following values for the yield stress ($R_{p0,2}$) and material thickness t result from the tensile tests on the material strips:

Versuch Nr.	$R_{p0,2}$ [N/mm ²]	t [mm]
N I	396	2,03
R II	396	2,00
N III	433	2,01

The uprights with the marking I und II have the same yield stress, while the yield stress of the upright with the marking III is ca. 9% greater. This fact is reflected also in the results of the compression tests. The failure loads of the specimen N III und R III are on average also ca. 9% greater than the failure loads of the other specimen.

The calculation according to FEM 10.2.02 with respect to flexural buckling and flexural torsional buckling (see annex A.2) gives the following design values for the failure load $N_{b,Rd,min}$:

Specimen NI to RII : $N_{b,Rd,min} = 134,2 \text{ kN}$

Specimen NIII and RIII: $N_{b,Rd,min} = 143,2 \text{ kN}$

The failure loads reached in the tests are greater than the calculated values.

4. Summary

In the here conducted compression tests, no reduction of the load bearing capacity of uprights after a single repair could be observed.

The theoretic design failure loads according to FEM 10.2.02 for the specimen were exceeded in all tests.

A.3 Record of taking out the specimen (by IKEA)

- 1 -

Probernahme durch: M. Lucas, IKEA
Ort: DC Oosterhout
Datum: 24.10.2007
Hersteller: STOW

Proben Nr.:	Kennung	Zustand	Anzahl Reparaturen	Länge
1	N I	Neu	0	1.150 mm
2	R I	Repariert	1	1.150 mm
3	N II	Neu	0	1.150 mm
4	R II	Repariert	1	1.150 mm
5	N III	Neu	0	1.150 mm
6	R III	Repariert	1	1.150 mm

Datei: 2007RACK12_Proben.xls

Stand: 31.10.2007

Prüflaboratorium der Institut für Schweißtechnik und Ingenieurbüro Dr. Möll GmbH

An der Schleifmühle 6, 64289 Darmstadt, Tel. (06151) 74097 und 713051, Fax (06151) 74141

**Number of the
PLISIB-report:**

PLISIB - VB - 83/2007
(corresponds to section A.4 of the total report)

Tensile tests and determination of the yield stresses

Client:

Company
IKEA Distribution Services GmbH
Ellinghauser Straße 213
44359 Dortmund

Arrival:

December 2007

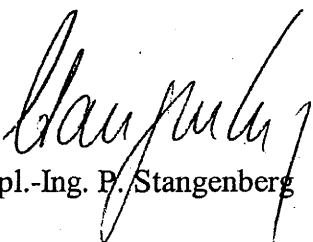

The report comprises:

8 pages (page 16 to 23)

The results of this report exclusively refer to the specimen tested according to this test report.

Darmstadt, 28th March 2008

Head of PLISIB:

Dipl.-Ing. P. Stangenberg

Page 16

This report is permitted to spread further only entirely and unchanged.

Extracts- or Changes require a written permission of the testing laboratory of the ISIB Dr. Möll GmbH
